

## **Cortex®-M23, M33: Armv8-M Architecture Training with Security Extension - Face-to-Face Training**

Get familiar with the new Armv8-M architecture (Cortex®-M23 and -M33) and learn how to write software in C and Assembler. This workshop focuses on software and covers a variety of topics, such as the TrustZone, processor architecture, extended instruction set, exception behavior, and many more. After the training, you can locate programs in memory in secure and non-secure configuration and test them - the perfect start for designing Cortex®-M23/M33 based systems.

### **Objectives**

Get familiar with the new Armv8-M architecture (Cortex®-M23 and -M33) and learn how to write software in C and Assembler.

This workshop focuses on software and covers a variety of topics, such as the TrustZone, processor architecture, extended instruction set, exception behavior, and many more.

After the training, you can locate programs in memory in secure and non-secure configuration and test them - the perfect start for designing Cortex®-M23/M33 based systems.

### **Participants**

Hardware and software developers

### **Requirements**

A basic understanding of ANSI-C and microcontrollers.

## **Cortex®-M23, M33: Armv8-M Architecture Training with Security Extension - Face-to-Face Training**

### **Content**

#### **TrustZone for Armv8-M**

- Secure state transitions
- Function calls from secure state to non-secure state
- Function returns from non-secure state
- Practical exercises: Developing and setting up mixed secure state/non-secure state projects for Cortex-M33

#### **Cortex®-M (Armv8-M) Processor Architecture**

- Register organization, special purpose register
- Operation modes (handler/thread, privileged/unprivileged)
- Main stack, process stack, stack limit register
- Cortex®-M pipeline concept
- Cortex®-M memory map, system control block
- Practical exercises with the new stack limit registers
- Differences to the Armv6-M and Armv7-M processor architecture

#### **Cortex®-M33, M23, M7, M4, M3, M1, M0+, M0 Instruction Set**

- Thumb-2 instruction set
- Data processing instructions
- Branch and control flow instructions, subroutines
- Branch table, if ... then conditional blocks
- Data access instructions

- Security instructions
- Assembler directives
- Practical exercises: Assembler routine development, assembler debugging, code optimization

**Exception and Interrupt Handling**

- Exception model
- Reset, NMI, faults, SysTick, debug, supervisor calls, external interrupts
- Tail chaining, late arriving, tail chaining with security transitions
- Nested vector interrupt controller (NVIC)
- Interrupt configuration and status
- Interrupt prioritization, priority grouping
- Security targeting
- Banked exceptions
- Secure faults
- Practical exercises with system tick, supervisor call and PendSV in the context of RTOS applications
- Practical exercises with fault handlers and output of status information

**Memory Protection Unit MPU for Embedded Systems**

- Armv6-M and Armv7-M MPU
- New Armv8-M MPU
- Practical exercises: MPU programming and dynamic reprogramming in the scheduler

**Security Attribution Unit (SAU and IDAU)**

- Overview: Security and implementation defined attribution unit
- Attribution attributes secure, non-secure, non-secure callable
- Practical exercise: Programming the security attribution unit

**Embedded Core Debugging**

- Core and system debugging
- JTAG debug port
- 2-pin single wire debug port
- Trace port interface unit
- Embedded trace macrocell
- Practical exercise: Debugging C code with the µVision debugger and print output to the debug console

**Embedded Software Development**

- Adjustment of library routines to hardware (retargeting)
- Placing code and data in memory (scatter loading)
- Linker description files
- Processor start-up, start-up file
- Practical exercise: Placing code and data at predefined addresses

**Efficient C-Programming for Cortex Architectures**

- Compiler optimization, compiler options
- Interface C - Assembler
- Programming guidelines for Cortex compilers
- Optimized utilization of local and global data
- Tools: Arm, IAR, GNU

**Hardware-near C-Programming According to CMSIS**

- Cortex Microcontroller Software Interface Standard (CMSIS)
- Software architecture for embedded systems
- Structured description of peripherals
- Access to peripherals in C
- C statements and their execution in Assembler
- CMSIS extensions for Armv8-M

**Practical Exercises with Keil µVision in Assembler and C**

- Armv6-M and Armv7-M programs are developed and tested on a Cortex-M based evaluation board
- Exercises for Armv8-M are performed using a LPCXpresso55S69 board

**MicroConsult PLUS:**

- Download of exercises
- In addition, installation instructions and download links for the tool environment will allow you to repeat the exercises after the training.

---

**FREE:** Attendees of select trainings dates (please check back with us) get a free **LPCXpresso55S69** board featuring an **LPC55S69** dual-core Arm Cortex®-M33 microcontroller.

## FACE-TO-FACE TRAINING

Price *	Duration
2.800,00 €	4 days
Training code: E-ARMV8MS	
* Price per attendee, in Euro plus VAT	

### Live Online - English

#### Duration

4 days

### Face-To-Face - German

Date	Duration
04.05. – 07.05.2026	4 days

4 days

### Coaching

Our coaching services offer a major advantage: our specialists introduce their expertise and experience directly in your solution process, thus contributing to the success of your projects.

We will be happy to provide you with further information or submit a quotation tailored to your requirements.
